Interpretation of the Output - The output of `gprof` provides a detailed profile of your program's execution, showing time spent in each function & number of calls to each function. Visualizing this data with `gprof2dot` creates a call graph. `gprof2dot` creates a call graph that highlights the relationships & call frequencies between functions.

Nodes represent functions. Edges represent calls from one function to another. The size of nodes & thickness of edges can indicate the time spent in funⁿ & freq. of calls.
